The BCS Practitioner Certificate in Systems Modelling and Development provides professionals with a comprehensive understanding of how modelling facilitates the comprehension of complex systems and how development applies industry-standard models and processes to transform abstract concepts into operational solutions.

Prerequisites

There are no formal prerequisites for this certification. However, a foundational understanding of information systems and development processes is beneficial for participants.

Target Audience

This course is designed for:

- Business analysts seeking to enhance their modelling and development skills.
- Designers involved in creating system architectures.
- Developers aiming to understand the broader context of system development.
- Testers focusing on validating system models and developments.
- Technical architects responsible for overseeing system integration and performance.

What You Will Learn

By the end of this course, learners will be able to:

- Understand the role of modelling in analysing and designing complex systems.
- Apply industry-standard development methods and approaches to system development.
- Identify and define team structures, roles, and responsibilities in system development projects.
- Utilise process modelling techniques to represent system functionalities.
- Evaluate the suitability of bespoke versus off-the-shelf solutions in system development
