Overview

This foundation-level course provides a comprehensive introduction to enterprise and solution architecture. It equips learners with a fundamental understanding of architectural concepts, practices, and subdomains, from business architecture through to security and infrastructure. Participants will explore the importance of alignment between business and IT, and how architecture contributes to designing systems that are efficient, compliant, and cost-effective. Designed for both aspiring and early-career architects, this course lays the groundwork for further certification and practical application in architecture roles.

Prerequisites

There are no formal prerequisites for this course. It is accessible to anyone interested in understanding enterprise and solution architecture, regardless of prior experience.

Target audience

This course is aimed at individuals involved in or transitioning into architecture roles, including enterprise, solution, and domain-specific architects. It is also suitable for professionals seeking to broaden their knowledge of architecture domains or begin their certification journey in enterprise architecture.

What You Will Learn

By the end of this course, learners will be able to:

- Define the concept of architecture and describe the different levels it includes
- Distinguish between various types of architecture and their roles in the IT/IS industry
- Understand the strategic business context and the need for business-IT alignment
- Describe architectural precursors such as goals, directives, and constraints
- Explain the process of architecture development and common description frameworks
- Identify and understand the subdomains of enterprise and solution architecture
- Recognise the core activities and artefacts produced within each architectural domain
