Building and Automating an Azure infrastructure Training

Duration: **4 Day**

BILGINC IT Academy
info@bilginc.com
bilginc.com

This four-day instructor led course will provide delegates with the knowledge and skills to migrate data to Azure and then use Infrastructure as a Service (IaaS) and Platform as a Service (PaaS) solutions to continue their journey into Azure.

Delegates will learn how to assess their current IT infrastructure and then migrate data from on-premises into Azure. They will also learn how to use tools in Azure to facilitate everything they do, including the cloud shell, compute gallery and extensions. Delegates will learn how to build resources including virtual machines, storage accounts and apps, and then learn how to successfully monitor these resources, including setting up alerts and actions to be taken for problems within their resources.

Instructors will demonstrate features throughout the event. Lab exercises will be given to students to complete using a time-limited subscription.

Prerequisites

Important - This course has MFA Requirements. Please read this link and download the MFA app, prior to attending.

- Attendance of the MAZ9000 course, or MAZ9000-TL or the same knowledge
- An understanding of core technical concepts, including DNS, Networking, Identities, and software deployment methods
- An understanding of virtualisation and building resources in Azure
- Experience with Azure at a fundamental level

Target Audience

This course was designed for people who work in an Azure security administrator job role or a general purpose administrator role with a responsibility to ensure that after migrating to Azure, they know how to use the tools that are available.

Building and Automating an Azure infrastructure Training

Duration: **4 Day**

What You Will Learn

- Build virtual networks and manage the security for them
- Migrate vms from on premises
- Set up hybrid connectivity from on-premises into Azure for both offices and homes
- Deploy a bastion to allow secure connectivity to Azure without exposing unnecessary ports
- Build virtual machines in the most efficient way
- Use templates to redeploy resources and ensure consistency
- Use the serial console to work with resources to connect to and troubleshoot virtual machines
- Use the compute gallery to store applications and images for efficient deployment of vms
- Manage storage in Azure and work with backups
- Consider and choose the appropriate SQL database import options
- Migrate a dot.net application from their on-premises environment
- Work with App services
- Use logic apps and automation accounts to enhance automation
- Monitor resources built in Azure and have a way of visualising what is happening across their Azure environment
