Cloud Sparks Introduction to Gemini Enterprise provides an introduction to how organisations can use artificial intelligence to improve information discovery, enterprise data access and collaboration across teams.

The course explores how Gemini Enterprise brings together AI agents, enterprise search, Gemini Notebook and intelligent data access. Learners examine how these capabilities can be connected to genuine business requirements and used to make fragmented organisational knowledge easier to discover and access.

In addition to introducing the platform's primary capabilities, the course provides an understanding of the architecture behind Gemini Enterprise. Learners explore its main technical elements, how these components work together to produce an output, and how enterprise information can be made available to different user roles.

Security and privacy are also important areas of the program. Google Cloud security concepts are considered alongside authentication, authorisation and role-based data access to demonstrate how Gemini Enterprise can provide appropriate access to organisational information for different users.

Through practical scenarios, class activities and instructor demonstrations, learners also examine common organisational challenges such as data silos and fragmented information and consider how Gemini Enterprise can help address these issues.

Prerequisites

Advanced technical expertise is not required. However, learners should ideally have:

- An interest in improving data discovery, information access and collaboration between teams
- Some familiarity or experience with cloud platforms such as Google Cloud

Who Should Attend

This course is suitable for:

- Business professionals and decision-makers looking to improve enterprise data discovery and access
- IT and data professionals seeking to simplify organisational knowledge management and reduce data silos
- Teams considering AI agents and LLMs for enterprise search and collaboration
- Anyone interested in understanding secure, role-based access to enterprise information using Google Cloud technologies
