- Data roles
- Data engineering walkthrough
- Data types and groupings
- Data warehouse
- ELT, ETL and pipelines
- Modern data warehouse 2.0
- Architecture and compliance Documenting design

Prerequisites

This is a fundamental 1-day course, an interest in Data Engineering or the role of a data engineer would be useful, but not essential.

Target Audience

For those who manage a data team and would like to gain a better understanding of the data engineer role, or are looking to work with or become a data engineer. This course is an overview of the role and shows the importance of the data engineer to a successful data team.

What You Will Learn

- Introduction to data engineering core concepts listing the skills required and the personality to perform the role.
- An end to end walkthrough of the Data Engineering tasks and terms.
- Reviewing the data pipelines with no or little code to the perform ETL or ELT, then expanding the breadth by adding SQL data queries and Python data manipulation
- Recognising the data architecture choices presented to the data engineer and modelling the data to suit both the data store and data retrieval needs.
- Reviewing the concepts and technologies in a DW 2.0 environment including data lakes and lakehouses.
- Covering the disposal of data and the possible approaches to perform this.
- Documenting the data engineering performed, holding metadata and aligning data governance within the organisation.
