Duration: **1 Day**

Overview

What is data, where does it come from, how is it stored and what is it used for? Data touches every part of our lives and yet we often do not know it is there, what the data is, where it came from, or how we use it.

This course is designed to provide you with an essential understanding of data from generation to use. It is a first step towards increasing data awareness and confidence. The course is a starting point for data literacy learning and beyond.

Alternatively, if you wish to gain a deeper fundamental understanding of the role data can play, data structures, data quality and how you can use data to produce analysis to turn data into information and create a data story, then you may find the QADLFUND - Fundamentals of Data Literacy course is more suitable.

Prerequisites

There are no formal prerequisites for the course. You just need to have a desire to take your first steps towards working more effectively with data.

Target Audience

Anyone from any sector who needs to start a journey towards a data-driven role and has no formal data training.

What You Will Learn

- Recognise where and how data can be generated
- Understand the principles of data types and storage
- Identify how data can be used
- Consider data governance and ethics
- Gain an understanding of roles that use or are impacted by data
