Overview

Accelerated hands-on training to boost developer productivity powered by Red Hat OpenShift

Containers, Kubernetes, and Red Hat OpenShift Development II (DO295) teaches you how to design, build, and deploy containerized software applications to an OpenShift® cluster. Whether you are tasked with writing container-native applications or migrating existing brownfield applications, this course provides hands-on training to boost developer productivity powered by Red Hat OpenShift. This course is based on OpenShift Container Platform 4.6.

Who Should Attend

- Developers who wish to containerize software applications.
- Administrators who are new to container technology and container orchestration.
- Architects who are considering using container technologies in software architectures.
- Site reliability engineers who are considering using Kubernetes and OpenShift.

What You Will Learn

- Explore container and OpenShift architecture
- Create containerized services
- Manage containers and container images
- Build custom container images
- Manage and trigger application builds
- Customize an existing source-to-image base image
- Develop an OpenShift template
- Generate health checks to monitor and improve application reliability

Outline

Introduction to container technology
    Describe how software can run in containers orchestrated by Red Hat OpenShift Container Platform.
Create containerized services
    Provision a server using container technology.
Manage containers
    Manipulate prebuilt container images to create and manage containerized services.
Manage container images
    Manage the life cycle of a container image from creation to deletion.
Create custom container images
    Design and code a Dockerfile to build a custom container image.
Deploy containerized applications on OpenShift
    Deploy single container applications on OpenShift Container Platform.
Troubleshoot containerized applications
    Troubleshoot a containerized application deployed on OpenShift.
Deploy and manage applications on an OpenShift cluster
    Use various application packaging methods to deploy applications to an OpenShift cluster, then manage their resources.
Design containerized applications for OpenShift
    Select a containerization method for an application and create a container to run on an OpenShift cluster.
Publish enterprise container images
    Create an enterprise registry and publish container images to it.
Build applications
    Describe the OpenShift build process, then trigger and manage builds.
Customize source-to-image (S2I) builds
    Customize an existing S2I base image and create a new one.
Create applications from OpenShift templates
    Describe the elements of a template and create a multicontainer application template.
Manage application deployments
    Monitor application health and implement various deployment methods for cloud-native applications.
Perform comprehensive review
    Create and deploy cloudinative applications on OpenShift.
